Signal Diagram

The subsequent circuit generates a signal on the INIT line. The position sensor answers with a START and a STOP signal.

$$\text{Position value } x = t(x) \cdot v_s$$

The position value will be calculated by multiplication of the time interval $t(x)$ with the conversion factor specified on the type label.

POSICHRON[®] Output Specification SSI

Description

The data transmission takes place by means of the two signals CLOCK and DATA. The processing unit (PLC, Microcomputer) sends pulse sequences which clocks the data transmission at the required transfer rate. With the first falling edge of the pulse sequence the position of the sensor is recorded and stored. The following rising edges control the bit-by-bit transmission of the data word. After a delay time the next new position information will be transmitted.

Data Format (Train of 26 pulses)

SSI (synchronous serial)

Output	EIA RS-422, RS-485, short-circuit proof
Excitation Voltage	+12 ... +27 V DC, residual ripple 10 mV _{SS}
Excitation Current	150 mA max. without load
Clock Frequency	100 kHz ... 1 MHz
Code	Gray 24 bit, continuous progression
Resolution	2 µm max.
Delay between Pulse Trains	>25 µs
Stability (Temperature)	±20 x 10 ⁻⁶ / °C full scale
Operation Temperature	-40 ... +85 °C
Immunity to Interference (EMC)	According to EN50082-2, EN50081-1

Signal diagram

Cable length	Baud rate
50 m	100 ... 1000 kHz
100 m	100 ... 300 kHz

Note:
Extension of the cable length will reduce the maximum transmission rate.
The signals CLOCK/CLOCK and DATA/DATA must be connected in a twisted pair cable, shielded per pair and common.
